

R&D

CHALLENGING INNOVATIONS

In order to offer the best products, we will anticipate your company's needs before they arise. In this way, we work actively to not only be an industry leader but also push the development forward in the field. In our R&D department, we develop and produce the products of the future.

To be able to offer high-tech products that are tailored for the Swedish and European market, it is necessary for us to not only follow but to drive the development forward. In our R&D department, we are working on projects that will enhance and refine our range of products, such as product optimizations and certifications. We also try to increase the understanding of how products interact and how they should be implemented to achieve the best possible results.

Consulting and customer development is just as important to us. We also work in close collaboration with customers with specific needs to develop products that meet these needs in a superior way.

PROJECTS

At the moment, we have a number of development projects in the pipeline. When a new product has been introduced, it goes through thorough testing within the company and in some circumstances even with SP Technical Research Institute of Sweden to obtain a product licence in cases which such is needed. The certificate may be seen as a seal of quality for our customers and it indicates that the product has been tested to keep what it promises.

Interactive products

By using printed electronics materials can tell when they are exposed to moisture. We at Staga are trying to take advantage of this fact and would create construction and/or hygiene products that tell you when and where they are wet.

Roofing products

We are now developing new types of roofing materials that allow bi-directional steam transport while it provides rain protection to insulation and frames. Both time and money is saved by combining several different traits in a product. The air gap which you normally have in a roof structure will be made completely obsolete with roofing materials in which the moisture is transported through the work material without condensation occurring.

Radon products

We are working on the next step and get a certification of our radon products. We know that the products work as promised and provide excellent protection against radon in houses, but a certificate is always a security for you as a customer. Staga Radon membranes is a completely new type of product that is basically completely moisture proof, whereas on the market today there are just plastic films which are not 100% moisture proof no matter how thick you make them.
